Efficiency  
Make & Model Number

Statement of Compliance: The proposed building design represented in these documents is consistent with the building plans, specifications, and other calculations submitted with the permit application. The proposed building has been designed to meet the requirements of the International Energy Conservation Code.

Builder/Designer ___________________________ Company Name ___________________________ Date ________________________

Plan review for energy code compliance can be conducted quickly and efficiently. The U.S. Department of Energy’s REScheck Compliance Software is designed to create simplified compliance certificates that can be easily reviewed by enforcement personnel. This Quick Reference Guide will guide you, step-by-step, through a typical plan review process. There are three basic steps for conducting a building energy code plan review:

Step 1: Verify the documentation has been correctly prepared.

Step 2: Verify the levels of efficiency shown on the plans meet or exceed that shown in the documentation.

Step 3: Verify all of the information to conduct a field inspection is included in the plans or documentation for the inspector to use on site.

Code Compliance Responsibilities
Successful compliance requires the cooperation of many individuals involved in a building project: designers, engineers, architect, building owners, etc. Compliance also requires the efforts of certain individuals to whom the code gives specific responsibilities:

- Applicant
- Building Official
- Plans Examiner or Special Plans Examiner
- Inspector or Special Inspector

Role of the Applicant
The applicant is the person named on the building permit. The applicant is ultimately responsible for meeting all requirements specific in the code. The applicant may be the owner, architect, engineer, contractor or any other authorized agent for the project owner who applies for the building permit.

Role of the Building Official
The building official is typically responsible for enforcing all provisions of the code. To carry out code enforcement, the building official may appoint technical officers and inspectors.

Role of the Plans Examiner or Special Plans Examiner
Plans examiners and Special Plans Examiners are typically responsible in verifying the plans for energy code compliance.

Role of the Inspector or Special Inspector
Inspectors and Special Inspectors are responsible in conducting field inspections for energy code compliance.
Step One: Verify the project information matches the information on the building plans. The code, city, and state on the building plans will impact energy code compliance.

Step Two: Verify the project complies with the applicable code. The Maximum UA must be greater than or equal to the Your Home UA to demonstrate compliance.

Step Three: Verify the Gross Area or Perimeter R-value shown on the building plans meet or exceed the values in the Cavity R-value and Continuous R-value section. Verify the insulation will fit uncompressed in the framing cavity. Continuous R-values are for insulation installed over the face of framing.

Step Four: Verify the window and door U-factors shown on the building plans meet or exceed the values shown on the plans. Materials that separate conditioned from unconditioned spaces such as a garage should be included in the wall area.

Step Five: Verify the window and door U-factors shown on the building plans meet or exceed the values shown on the plans. Materials that separate conditioned from unconditioned spaces such as a garage should be included in the wall area.

PROJECT TITLE: Jones Residence - Plan 3677

Air Conditioner 1: Electric Central Air, 10 SEER

COMPLIANCE STATEMENT: The proposed building design described here is consistent with the building plans, specifications, and other calculations submitted with the permit application. The proposed building has been designed to meet the 2003 IECC requirements in REScheck Version 3.6 Release 1a (formerly MECcheck) and to comply with the mandatory requirements listed in the REScheck Inspection Checklist.

Builder/Designer___________________________________________  Date_______________

**Step Six:** Verify the correct floor components that define the building envelope are shown. For example, a floor over a crawl that is vented to the outside; the crawl wall would not be part of the building envelope and should not be shown on the report.

Verify the slab-on-grade is entered in linear feet.

**Step Seven:** If a Furnace or Air Conditioner is called out in the documentation verify the rated efficiency of the system is called out on the plans.

DATE: 11/10/04  
PROJECT TITLE: Jones Residence - Plan 3677

### Step Eight: Verify that the R-values and U-factors and efficiencies listed on the inspection form match the values listed in the preceding section. Include any comments to the inspectors in this section. Check the comments on each of the sections to ensure that they apply to the project.

#### Ceilings:
- **1. Ceiling 1:** All-Wood Joist/Rafter/Truss, R-38.0 cavity insulation  
  Comments: ______________________________________________________________

#### Above-Grade Walls:
- **1. Exterior Wall 1:** Wood Frame, 16” o.c., R-19.0 cavity insulation  
  Comments: ______________________________________________________________
- **2. Exterior Wall 2 South:** Wood Frame, 16” o.c., R-19.0 cavity insulation  
  Comments: ______________________________________________________________
- **3. Exterior Wall 3 East:** Wood Frame, 16” o.c., R-19.0 cavity insulation  
  Comments: ______________________________________________________________
- **4. Exterior Wall 4 West:** Wood Frame, 16” o.c., R-19.0 cavity insulation  
  Comments: ______________________________________________________________
- **5. Knee Wall West:** Wood Frame, 16” o.c., R-19.0 cavity insulation  
  Comments: ______________________________________________________________
- **6. Knee Wall East:** Wood Frame, 16” o.c., R-19.0 cavity insulation  
  Comments: ______________________________________________________________

#### Basement Walls:
- **1. Basement Wall 2:** Solid Concrete or Masonry, 9.0’ ht/4.5’ bg/9.0’ insul, R-19.0 cavity insulation  
  Comments: ______________________________________________________________
- **2. Basement Wall 1:** Solid Concrete or Masonry, 9.0’ ht/4.5’ bg/9.0’ insul, R-19.0 cavity insulation  
  Comments: ______________________________________________________________
- **3. Basement Wall 3:** Solid Concrete or Masonry, 9.0’ ht/7.0’ bg/9.0’ insul, R-19.0 cavity insulation  
  Comments: ______________________________________________________________

#### Windows:
- **1. Window main:** Vinyl Frame, Double Pane, U-factor: 0.400  
  For windows without labeled U-factors, describe features:  
  # Panes____ Frame Type___________ Thermal Break? [ ] Yes [ ] No  
  Comments: ______________________________________________________________
- **2. Window 2:** Vinyl Frame: Double Pane with Low-E, U-factor: 0.400  
  For windows without labeled U-factors, describe features:  
  # Panes____ Frame Type___________ Thermal Break? [ ] Yes [ ] No  
  Comments: ______________________________________________________________
- **3. Window 3:** Vinyl Frame: Double Pane with Low-E, U-factor: 0.400  
  For windows without labeled U-factors, describe features:  
  # Panes____ Frame Type___________ Thermal Break? [ ] Yes [ ] No  
  Comments: ______________________________________________________________

#### Doors:
- **1. Door 1:** Opaque, U-factor: 0.500  
  Comments:  
  **2. Door 2:** Solid, U-factor: 0.500  
  Comments:  

#### Floors:
- **1. Floor 1:** All-Wood Joist/Truss, Over Unconditioned Space, R-19.0 cavity insulation  
  Comments:  
- **2. Floor 2:** Slab-On-Grade: Unheated, 2.0’ insulation depth, R-5.0 continuous insulation  
  Slab insulation to extend down from the top of the slab to at least 2.0 ft. OR down to at least the bottom of the slab then horizontally for a total distance of 2.0 ft. Exterior insulation must have a rigid, opaque, weather-resistant protective covering that covers the exposed (above-grade) insulation and extends at least 6 in. below grade.

#### Heating and Cooling Equipment:
- **1. Furnace 1:** Forced Hot Air, 78 AFUE or higher  
  Make and Model Number  
- **2. Air Conditioner 1:** Electric Central Air, 10 SEER or higher  
  Make and Model Number
Air Leakage:
[ ] Joints, penetrations, and all other such openings in the building envelope that are sources of air leakage must be sealed.
[ ] Recessed lights must be 1) Type IC rated, or 2) installed inside an appropriate air-tight assembly with a 0.5" clearance from combustible materials. If non-IC rated, the fixture must be installed with a 3" clearance from insulation.

Skylights:
[ ] Minimum insulation requirement for skylight shafts equal to or greater than 12 inches is R-19.

Vapor Retarder:
[ ] Required on the warm-in-winter side of all non-vented framed ceilings, walls, and floors.

Materials Identification:
[ ] Materials and equipment must be installed in accordance with the manufacturer's installation instructions.
[ ] Materials and equipment must be identified so that compliance can be determined.
[ ] Manufacturer manuals for all installed heating and cooling equipment and service water heating equipment must be provided.
[ ] Insulation R-values and glazing U-factors must be clearly marked on the building plans or specifications.

Duct Insulation:
[ ] Supply ducts in unconditioned attics or outside the building must be insulated to R-8.
[ ] Return ducts in unconditioned attics or outside the building must be insulated to R-4.
[ ] Supply ducts in unconditioned spaces must be insulated to R-8.
[ ] Where exterior walls are used as plenums, the wall must be insulated to R-8.

Duct Construction:
[ ] Duct connections to flanges of air distribution system equipment must be sealed and mechanically fastened.
[ ] All joints, seams, and connections must be securely fastened with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric, or tapes. Tapes and mastics must be rated UL 181A or UL 181B. Exception: Continuously welded and locking-type longitudinal joints and seams on ducts operating at less than 2 in. w.g. (500 Pa).
[ ] The HVAC system must provide a means for balancing air and water systems.

Temperature Controls:
[ ] Thermostats are required for each separate HVAC system. A manual or automatic means to partially restrict or shut off the heating and/or cooling input to each zone or floor shall be provided.

Service Water Heating:
[ ] Water heaters with vertical pipe risers must have a heat trap on both the inlet and outlet unless the water heater has an integral heat trap or is part of a circulating system.
[ ] Insulate circulating hot water pipes to the levels in Table 1.

Circulating Hot Water Systems:
[ ] Insulate circulating hot water pipes to the levels in Table 1.

Swimming Pools:
[ ] All heated swimming pools must have an on/off heater switch and require a cover unless over 20% of the heating energy is from non-depletable sources. Pool pumps require a time clock.

Heating and Cooling Piping Insulation:
[ ] HVAC piping conveying fluids above 105 °F or chilled fluids below 55 °F must be insulated to the levels in Table 2.

Table 1: Minimum Insulation Thickness for Circulating Hot Water Pipes.
